## TEST RESULTS

Test results for mechanical properties, deposit or electrode composition and diffusible hydrogen levels were obtained from a weld produced and tested according to prescribed standards, and should not be assumed to be the expected results in a particular application or weldment. Actual results will vary depending on many factors, including, but not limited to, weld procedure, plate chemistry and temperature, weldment design and fabrication methods. Users are cautioned to confirm by qualification testing, or other appropriate means, the suitability of any welding consumable and procedure before use in the intended application.

## CUSTOMER ASSISTANCE POLICY

The business of Lincoln Electric is manufacturing and selling high quality welding equipment, consumables, and cutting equipment. Our challenge is to meet the needs of our customers and to exceed their expectations. On occasion, purchasers may ask Lincoln Electric for information or advice about their use of our products. Our employees respond to enquiries to the best of their ability based on information provided to them by the customers and the knowledge they may have concerning the application. Our employees, however, are not in a position to verify the information provided or to evaluate the engineering requirements for the particular weldment. Accordingly, Lincoln Electric does not warrant or guarantee or assume any liability with respect to such information or advice. Moreover, the provision of such information or advice does not create, expand, or alter any warranty on our products. Any express or implied warranty that might arise from the information or advice, including any implied warranty of merchantability or any warranty of fitness for any customers' particular purpose is specifically disclaimed.

Lincoln Electric is a responsive manufacturer, but the selection and use of specific products sold by Lincoln Electric is solely within the control of, and remains the sole responsibility of the customer. Many variables beyond the control of Lincoln Electric affect the results obtained in applying these types of fabrication methods and service requirements.

Subject to Change – This information is accurate to the best of our knowledge at the time of printing.  
Please refer to [www.lincolnelectriceurope.com](http://www.lincolnelectriceurope.com) for any updated information.

## Classification of flux for submerged arc welding

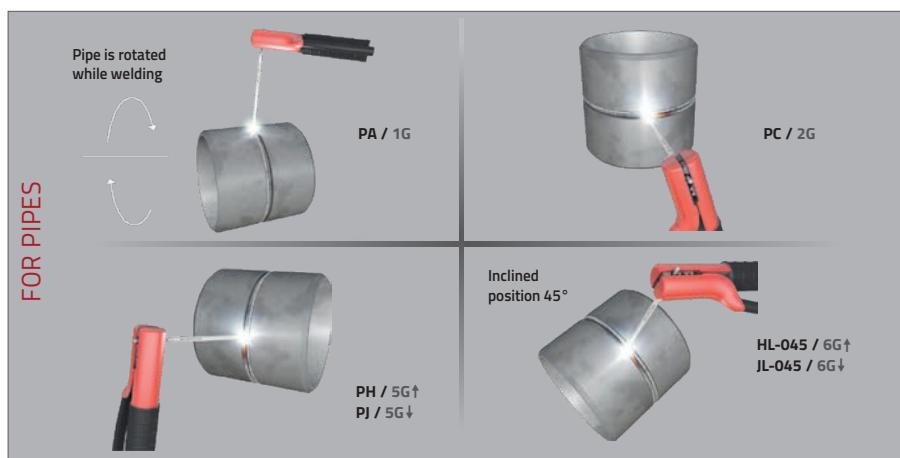

EN ISO 14171-A

## Classification of wire and wire/flux combinations for submerged arc welding of non alloy and fine grain steels

Some welding engineers prefer to use the standard AWS/ASME terminology for welding positions – some use a general description – some use a mixture of both! It is useful in describing welding procedures if we all understand each other. This chart shows the basic AWS/ASME (and BS EN) welding positions, together with the outline descriptions. The AWS/ASME positions are described in ASME IX and the European terminology is used in BS EN 287-1 and defined in ISO 6947.

### ASME (BS EN) POSITIONS

Type	Field of application	Deposit in cm <sup>3</sup> per electrode		
		Ø 3.2	Ø 4.0	Ø 5.0
Ferrod 135T	High recovery electrodes for fillet welds and horizontal V- and X-welds. Smooth weld appearance. High welding speed through high recovery of 135, 160 %	4.7	7.1	11.6
Ferrod 160T			8.5	14.2
Ferrod 165A	As Ferrod 160T. Higher welding speed. 160% recovery. Impact properties at -20°C	5.1	8.5	12.7
Universalis	Rutile type, especially for down hand fillet welding and filling in structural steel. Very smooth appearance.	2.7 <sup>1</sup> 3.5 <sup>2</sup>	3.9 <sup>1</sup> 5.1 <sup>2</sup>	
Cumulo	All positions fillet welding and filling f.i. for pipe welding (except vertical-down)	2.5	3.5	
Pantafix	Rutile all position electrode for most widely application. General construction, pipe welding, including vertical-down.	2.4	3.4	
Omnia	General purpose all position electrode. Low open circuit, small diameters for hobby market.	2.4/2.4	3.4/3.4	
Supra	All position rutile, excellent vertical down properties. Shipbuilding repairs.	2.4	3.3	4.9
Kardo	Basic electrode, low yield, low tensile, high impact.	3.0	4.4	
Baso 48SP	Rutile-basic electrode, excellent weldability, start and restart.	3.0	5.3	
Baso 100	Basic electrode for welding under difficult conditions	2.5 <sup>1</sup>	3.7 <sup>1</sup>	8.0
Baso 120	Basic electrode, 120% efficiency, for fast filling in all positions in difficult construction work	2.9 <sup>1</sup> 3.9 <sup>2</sup>	4.0 <sup>1</sup> 5.8 <sup>2</sup>	9.1

## DETERMINATION OF WELDING COSTS

weld content deposit per electrode	=	number of electrodes
price per electrode x number	=	costs of electrodes
number of electrodes x arc time	=	total arc time
total arc time x 100 percentage duty cycle	=	total work time
total work time x hourly wage	=	wage costs
costs of electrodes + wage costs	=	total costs

## Ferrite Number

To facilitate international communication (specifications, certifications), the internationally accepted term Ferrite Number (FN) has been introduced to indicate a delta-ferrite content in stainless steel weld metal.

The Ferrite Number is often used as an indicator of resistance to weld metal hot cracking. This aspect and other engineering properties have been correlated with the FN value of the weld metal. For various service conditions the following typical levels reflect good experiences:

- fully austenitic weld metal: FN < 0.5
- high corrosion resistance in severe oxidising and reducing acidic and chloride containing media: FN < 0.5
- fully austenitic CrNiMoN weld metal, non-magnetic: FN < 0.5
- low ferrite CrNiN and CrNiMoN weld metal, cryogenic applications: FN 3-6 or < 0.5
- general purpose stainless steel weld metal with corrosion resistance and high resistance to hot cracking and microfissures: FN 6-15
- buffer layer of austenitic/ferritic weld deposits for dissimilar joints and buffer layers in clad steel: FN 15-35
- austenitic/ferritic weld metal with high stress and pitting corrosion resistance as well as a balanced structure for toughness and corrosion: FN 30-70

## Control of welding of constructions often requires the determination of the Ferrite Number (FN)

### Ferrite Measurement

An internationally accepted standardised method to determine the ferrite content is based upon an arbitrarily defined relationship between a magnetic force and weld ferrite content. This is necessary because an absolute and correct determination of the ferrite content is not available as a result of inherent inaccuracy of metallographic examination and the nonexistence of a calibration method for the absolute ferrite content in stainless steel. The attracting force between a defined permanent magnet and weld metal, containing delta-ferrite is measured by means of a torsion balance. The values are in fact compared with the values obtained in measurements using the same magnet, attracting a carbon steel base plate with a non magnetic copper coating of a specified thickness. A calibration method provides the necessary linear relation. The principles are accepted as the international standard ISO 8249 and AWS A4.2-91. The European Standardization will adopt the ISO standard.

The range in the revised standards has been extended to 100FN (originally 0-28FN).

Coated thickness standards are available from the "U.S. National Institute of Standards and Technology" (NIST). A precision torsion balance or the commercially available "Magne Gage" (fig.3) are suitable for the determination of the Ferrite Number under laboratory conditions (horizontal position). A permanent magnet of defined dimensions and magnetic strength, according ISO 8249, shall be used.

Secondary standards for the checking and calibration of field equipment in the range 0-100FN are available from NIST.

### Calculation of ferrite content

The ferrite content is estimated on the basis of calculation, using the as deposited weld metal chemical composition.

The Cr- and Ni-equivalent is plotted in diagrams, based on the metallographic studies, such as:

- the Schaeffler Diagram<sup>1)</sup>, published in 1949, is considered as most suitable for a general picture of weld metal structures for a wide range of compositions, but not accurate for ferrite containing austenitic weld metals;
- the DeLong Diagram (1973)<sup>2)</sup>, widely used up to 1985, for a limited range of CrNi (Mo, N)-stainless steel weld metal grades;
- the WRC 1992 Constitution Diagram (1992), published by Kotecki and Siewert (1992)<sup>3)</sup> has been based upon the WRC 1988 Constitution Diagram, earlier published by Siewert, McCowan and Olson<sup>4)</sup> as a result of a review and of more than 950 weld metal sample analyses and FN determinations (including data from Lincoln Electric). For this diagram, a better accuracy has been reported due to the accurate determination of the effect of Mn, Si, C, N and Nb.
- Also reference is made to the ESPY Diagram<sup>5)</sup> for the calculation of the ferrite content.

<sup>1)-5)</sup> See References, p. 29

## Application of Ferrite Diagrams

The various ferrite diagrams are suitable to estimate the Ferrite Number in weld metal. Ongoing verifications indicate that the new WRC 1992 Constitution Diagram provides the best estimate. The old Schaeffler diagram still provide useful information in a wide range of weld metal compositions. It provides guidelines for dissimilar joints and welding clad steel, calculation of composition and position of the diluted weld metal.

The following pages contain a reprint of a combination of the Schaeffler and the WRC 1992 Constitution Diagram (fig. 1) and the standard WRC 1992 Constitution Diagram on full scale (fig. 2). In using these diagrams for the estimation of weld metal structure, one should always take into account the effects of different welding conditions (temperature/time-cycles, welding parameters, surface effects) which usually influence FN values, compared with measurements on all weld metal deposit samples.

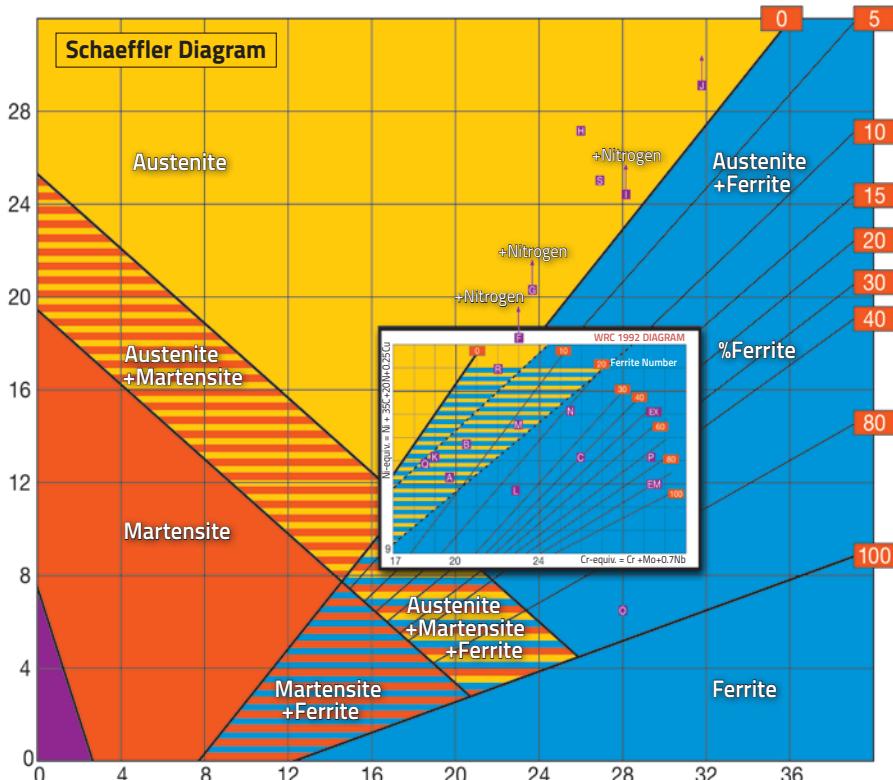

Fig. 1 Combined Schaeffler / WRC 1992 Constitution Diagram

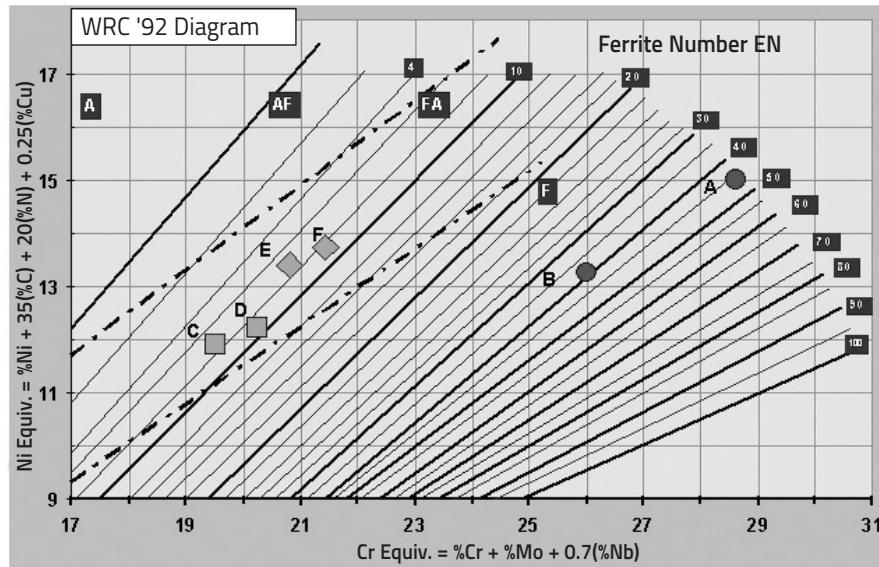

Fig. 2 WRC 1992 Constitution Diagram

### Position of welding consumables

The position of representative Lincoln Electric Europe welding consumables (table 1) has been marked in the combined Schaeffler-WRC 1992 Diagram (figure 1) and in the original WRC Diagram.

Table 1 Cr- and Ni-equivalent, calculated according Schaeffler and the WRC'92 Constitution Diagram

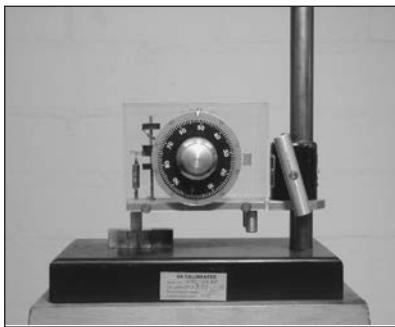

Fig. 3 Magne Gage

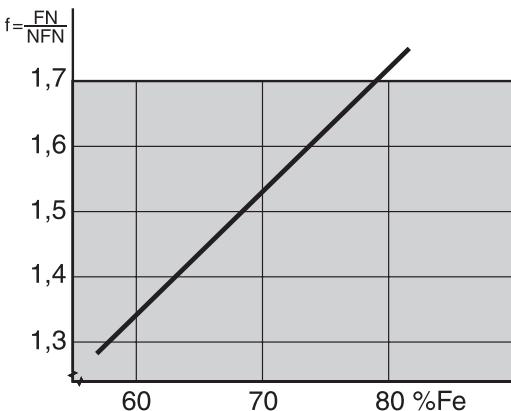

Fig. 4 Iron content versus factor f

### Ferrite Number versus Ferrite Content

The Ferrite Number is not equal to the volumetric ferrite content (%). Although an absolute ferrite content can not be measured accurately, a reasonable estimate of the ferrite content can be made by dividing the Ferrite Number by the factor f (% ferrite = FN / f) which is dependant of the iron content in the weld metal as shown in figure 4.

### Limitations

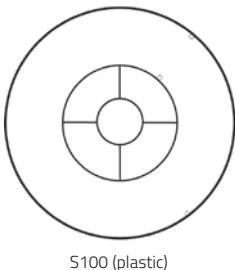

With the practice of measuring the Ferrite Number or ferrite content, welding conditions deviating from the standardised conditions have always to be taken into account. Furthermore, comparison tests showed that the accuracy between measurements in various laboratories may show differences up to +/- 10%.

### Lincoln Electric laboratories

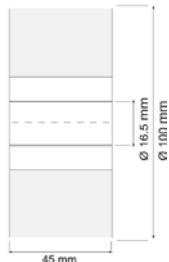

Since 1966 the Lincoln Electric R&D departments have always been involved in the international development of ferrite determinations. The laboratories are equipped with calibrated Magne Gages and on site measurement equipment. Primary coating thickness standards and secondary standards are available for contract calibration work.

## AccuTrak®

## FEATURES

- Drum structure done in resistant fiber carton
- Specifically designed retaining for easy pay off
- Approved Integrated Lifting Belts
- No hood needed
- Recyclable

## Gem-Pak™

## FEATURES

- Tangle Free - Prevents tangling and improves feedability
- Easy to Set-up - No external payoff devices required.
- Corrugated Cardboard Pallet - Fork-lift ready mini-pallet comes attached to the box for maximum portability and is 100% recyclable.

## Sahara ReadyPack®: Warehouse and quiver in pocket format

Electrodes in Sahara ReadyPack® really save time and money. For these electrodes there is no need to store in a conditioned warehouse or to use redry ovens and quivers. This innovation on an industrial scale has been a success for many years now. Millions of the well known Sahara ReadyPack® have been consumed in ship building, chemical industry and in offshore projects. The moisture resistant vacuum packaging fits well with the advantages of the remarkable EMR-Sahara® concept. EMR-Sahara® covered electrodes are designed to be low in moisture and show a very low moisture absorption. The internationally (IWW) agreed moisture resistance test demonstrates that the electrodes remain, after exposure during 24 hours at 27°C and 70% R.H., below a maximum hydrogen content of 5 ml/100g which is the criterium to call the electrodes MR: moisture resistant. Even more important is the fact that the electrodes can be consumed from an opened Sahara ReadyPack® within 12 hours, and still prove to produce a weld deposit with a very low in hydrogen content (HDM < 5 ml/100g). For a number of EMR-Sahara® electrodes the maximum HDM level is even 3 ml/100g.

A Sahara ReadyPack® actually replaces the functions of a conditioned warehouse and a redry oven, all in pocket format. Storage in a conditioned warehouse is no longer needed; most efficient is a small storage room at the job site. The use of a redry oven is not recommended. Up to the moment you open the Sahara ReadyPack®, and during the following period of 12 hours, EMR-Sahara® electrodes keep their initial quality. The convenient packages are easily carried to the welding place. The content of one or two package is usually good for one working day. A real cost saving is demonstrated in many cases, mainly because maintenance of quivers and quality control on redrying procedures is no longer needed. Not to mention the loss of unproductive time in transportation from the redry oven to the job site. The reliable Sahara ReadyPack® has indeed set a trend in the welding industry.

Properties of the Sahara ReadyPack® and its content, the EMR-Sahara® (basic) electrodes in summary:

- Diffusible hydrogen level HDM less than 5 ml/100g; a new generation provides even less than 3 ml/100g
- Low moisture pick-up of the EMR-Sahara electrode coating; 12 hours after opening of the Sahara ReadyPack® still provides electrodes with a hydrogen content of maximum 5 and 3 ml/100g respectively
- Storage does not need a conditioned warehouse
- Intermediate storage in a dry cabinet or quiver is not needed, even not recommended
- No mix-up of electrodes, as may happen with electrodes outside the packaging for redrying
- A most efficient handling procedure; cost savings can easily be calculated.

## The range of electrodes in the Sahara ReadyPack®

Currently the following moisture resistant very low hydrogen electrodes (basic EMR-Sahara® electrodes) can be supplied in Sahara ReadyPack®:

## 1. Scope

Covered arc welding electrodes, manufactured by Lincoln Electric Europe, delivered in their original packaging.

The packaging consists of either:

- A cardboard boxes in outer carton;
- B foil protected cardboard boxes in outer carton;
- C plastic (PE) boxes with sealed cap, suitable for reclosing;
- D hermetically sealed metal tin (LINC CAN™) in outer carton;
- E hermetically vacuum sealed aluminium foil packs Sahara ReadyPack® (SRP) in outer carton; ;
- F hermetically vacuum sealed foil packs (ProTech®, VPMD- Vacuum Pack Medium, VPMC- Vacuum pack Micro) in outer carton.

Electrode grades	Packaging type					
	A	B	C	D	E	F
Mild steel	X	X	X	X		X
Low alloy high strength steel		X		X		X
Low temperature fine grain steel		X		X	X	X
Creep resistant steel		X				X
Stainless steel		X	X	X	X	X
Duplex and Superduplex stainless steel		X				X
Nickel base electrodes			X			X
Hardfacing-; maintenance and repair electrodes			X			

## 2. Storage

2a. Storage of electrodes in cardboard boxes requires humidity and temperature controlled storage areas.

General recommended storage conditions include:

- temperature 17–27°C, relative humidity ≤60%
- temperature 27–37°C, relative humidity ≤50%.
- electrode boxes may be stored in layers to a maximum of 7.

2b. Plastic boxes require storage conditions suitable to cardboard boxes

2c. No temperature and humidity requirements are applicable for electrodes in Linc-Can Mini-Pack and Sahara ReadyPacks, providing that (vacuum) seal is present in undamaged packs.

General recommended storage conditions include:

- Sahara ReadyPacks & Mini-Pack in outer cartons may be stored in layers to a maximum of 7;
- Linc Can in outer boxes may be stored in layers to a maximum of 5;
- Prevent damage and heating above 60°C for Linc-Can and Sahara ReadyPacks;
- Prevent damage and heating above 40°C for Mini-Pack.

## 3. Handling

3a. Re-drying and subsequent holding, as recommended in table 1, is required for products in the following conditions

- rutile electrodes, being humidified for any reason;
- basic low hydrogen electrodes in cardboard boxes;
- basic low hydrogen electrodes, returned from shop floor or damaged Sahara ReadyPacks, Mini-Pack or Linc Can;
- stainless steel and Ni-base electrodes after long and unknown storage conditions (deviating from recommendations);
- Wearshield electrodes in plastic (PE) boxes, stored for more than 1 year under conditions as described under section 2a. or earlier when the condition deviates from those recommended.

3b. Electrodes in Sahara ReadyPack and Linc-Can can be used without re-drying, providing that vacuum or seal is present in the undamaged packaging. The electrodes can be consumed in the as received condition, direct from the packaging within a period of 8 hours after opening under the conditions of ≤35°C and ≤90% RH, with the electrodes remaining in the opened packaging and protected against excessive conditions as condensation, rain, etc. This time can be extended to 12 hours under the conditions of ≤27°C and ≤70% RH. Once opened Linc-Cans should be closed during welding operations using the plastic lid that is supplied with the tin. If vacuum or seal is not present, the electrodes shall follow the re-dry and holding procedure as recommended in table 1 for the EMR-Sahara® Range. Electrodes in Mini-Pack can be used without re-drying, provided that the vacuum is present in the undamaged packaging. The electrodes can be consumed in the as received condition, direct from the packaging within a period of 4 hours after opening under the conditions of ≤35°C and ≤90% RH, with the electrodes remaining in the opened packaging and protected against excessive conditions as condensation, rain, etc.

## REDRYING AND HOLDING RECOMMENDATIONS

The re-drying time / temperature listed in Table 1, is a general guideline. Specific individual re-drying instructions on the product label may differ.

Table 1. Covered electrode re-dry times and temperatures

Electrode product groups	Re-drying time (h)*	Temp. (°C)	Holding
Mild steel: - rutile E6013 - rutile E6012, E7024	0.5-1h 1-2h	70-80 100-120	Cabinet 10-20°C above ambient temperature
- basic, low hydrogen (HDM <8 ml/100g) - basic, very low hydrogen*	2-6h 2-6h	250-375 325-375	a. Holding oven max. one year at 120-180°C b. Quiver max. 10h at RT-125°C (see illustration fig. 1) c. Plastic (PE) box max. 2 weeks workshop conditions
Low alloy: - basic, very low hydrogen**	2-6h	325-375	
Hardfacing-; maintenance & repair electrodes			
Stainless steel: - non EMR-SAHARA electrodes - EMR-SAHARA range	1-6h 1-6h	200-300 125-300	Holding oven unlimited time at 75-125°C quiver max. 10h at RT-125°C
Ni-base	1-6h	200-300	

\* Re-drying can be repeated twice within the indicated max. time of 6h. Re-drying of electrodes should be carried out by taking them out of the packaging and place the electrodes in approx. 3 cm thick layers in a temperature controlled air-circulation oven.

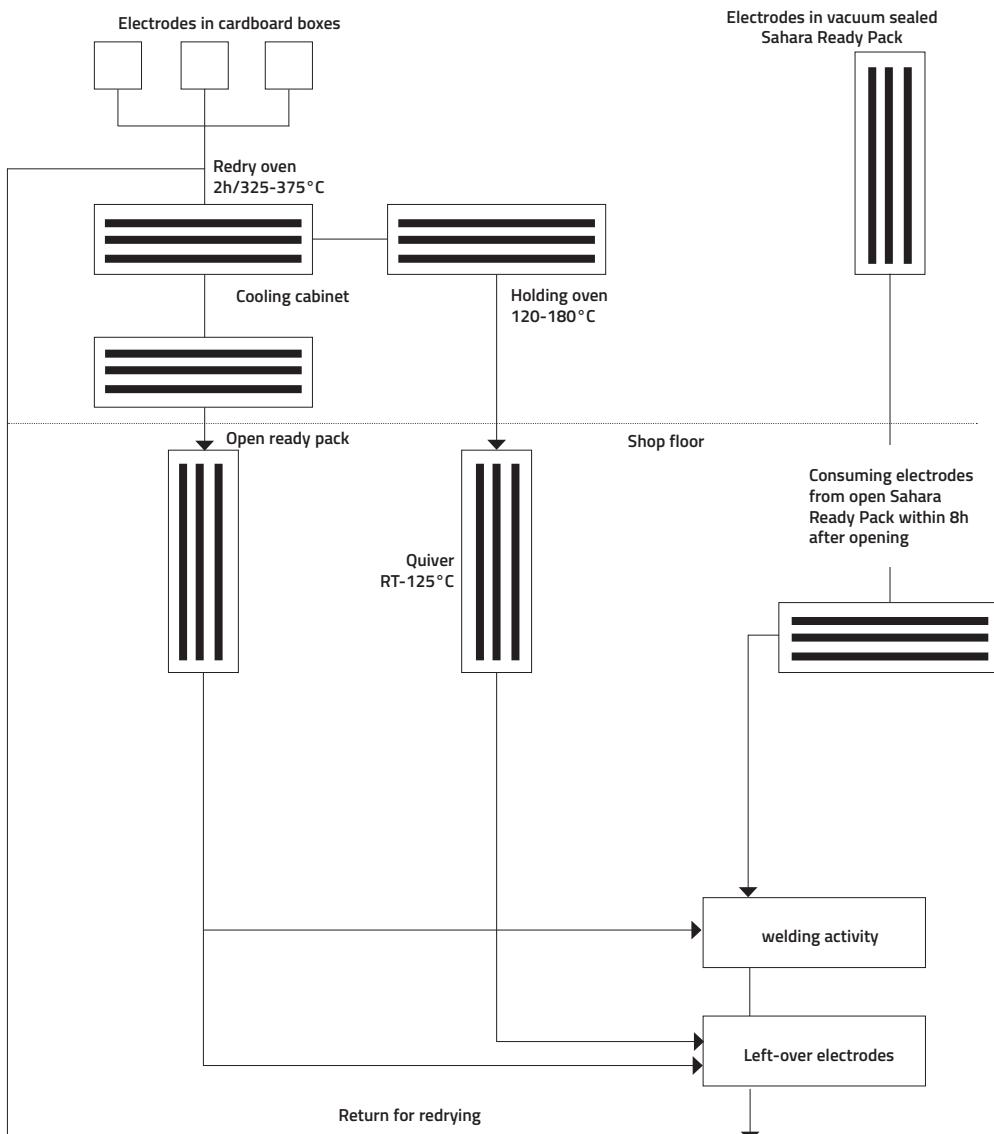

\*\* If these EMR-SAHARA, vacuum packing electrodes are re--dried a maximum content HDM of ≤5ml/100g is valid.

### 4. Deteriorated product

Covered electrodes that have suffered from serious water and moisture contamination, or have been exposed to the atmosphere over long periods of time cannot be restored in their original condition and should be discarded.

Figure 1:

Recommended handling procedure of EMR-SAHARA® electrodes after removal either from a regular cardboard box or vacuum sealed Sahara ReadyPack®

## FLUX-CORED WIRES

### **1. Scope**

Tubular cored wires with the following trade names are supplied in various spooling and packaging

Product family	Packaging
Gas shielded mild steel and low alloyed flux and metal cored wires.	<ul style="list-style-type: none"> <li>- spool in plastic bag in cardboard box</li> <li>- spool in Al/PE vacuum packaging in cardboard outer box</li> <li>- spool in plastic protection on pallet</li> <li>- Accutruk® drums</li> <li>- spool in cardboard box or plastic bucket or hermetically sealed cans</li> <li>- spool in plastic bag in cardboard box</li> </ul>

### **2. Storage**

Exposure to a humid environment with only a relative thin plastic foil shall be prevented.

Tubular wire, packed in the original foil and cardboard box or drum require controlled warehouse conditions such as:

- temperature 17-27°C, relative humidity: ≤60%;
- temperature 27-37°C, relative humidity: ≤50%.

INNERSHIELD wires in plastic buckets or in hermetically sealed cans and OUTERSHIELD as well as COR-A-ROSTA in Al/PE bags under vacuum, if applicable, do not require measures against moisture pick-up. Damage of the packaging shall be prevented.

### **3. Handling**

3a. OUTERSHIELD, INNERSHIELD xxx-H types and COR-A-ROSTA

Spools outside the protective packaging allow exposure to normal workshop conditions during ≤72 hours.

Drums fitted with the original lid or recommended drum hood allow exposure to normal workshop conditions during 2 weeks

3b. INNERSHIELD, non xxx-H types:

Spools outside the protective packaging allow 2 weeks exposure to normal workshop conditions.

In all cases the products require protection against contamination with moisture, dirt and oil products. During interruption of the production process for more than 8 hours, wire spools shall be stored in their plastic bag in the above-mentioned storage conditions.

### **4. Deteriorated product**

Cored electrode products that are rusty, have suffered from serious water and moisture contamination, or have been exposed to the atmosphere over long periods of time cannot be restored in their original condition and should be discarded.

## MIG WIRES & TIG RODS

### **1. Scope**

Solid wires and rods can be supplied in various packaging units in tubes, spools and drums.

### **2. Storage**

Exposure to a humid environment shall be prevented.

The following storage conditions are recommended.

Solid wire in the original packaging require controlled warehouse conditions such as:

- temperature 17-27°C, relative humidity ≤60%
- temperature 27-37°C, relative humidity ≤50%

### **3. Handling**

Rods and spools outside the protective packaging allow 2 weeks of exposure to normal workshop conditions.

In all cases, the products require protection against contamination with moisture, dirt and oil products.

During interruption of the production process for more than 8 hours, wire spools shall be stored in their plastic bag in the above mentioned storage conditions. Damage of packaging should be avoided

### **4. Deteriorated product**

Products that are oxidized, have suffered from serious water and moisture contamination, or have been exposed to the atmosphere over long periods, cannot be restored in their original condition and should be discarded.

## FLUX

### **1. Scope**

Welding fluxes are supplied in plastic bags, bulk bags, Sahara ReadyBags, Drybags, Bigbag Dry and metal drums

### **2. Storage**

The following storage conditions are recommended:

Welding fluxes, packed in plastic bags, require controlled warehouse conditions such as:

- temperature 17–27°C, relative humidity: ≤60%
- temperature 27–37°C, relative humidity: ≤50%

Product in metal drums, Sahara ReadyBags, Drybags and Bigbag Dry does not require special storage conditions but rust and damage of the packaging shall be prevented.

### **3. Handling**

Product characteristics as specified for the original condition, are retained if the product is treated in accordance with the following recommendations:

Packaging	Storage conditions	
	0–6 months, temperature ≤37°C or rel. humidity <50%	>6 months or temperature >37°C or relative humidity 50–90%*
Plastic bags	use as is**	redry 1–2h / 300–375°C
Sahara ReadyBag / Drybag / Bigbag Dry	use as is	use as is
Metal drums	use as is	use as is

\* if storage conditions include a relative humidity over 90% the flux may have been deteriorated so that re-drying becomes ineffective.

\*\* if a severe application is considered (HAZ or weld metal hardness HV10 >350, heavy restraint, etc.)  
re-drying 1–2h / 300–375°C is recommended.

For MIL800-H, MIL800-HPNi and 842-H fluxes Follow all previous procedures, with the following changes:

- Set temperature between 120°–205°C.
- For ovens in which heating rods are inserted into the flux, do not let the temperature of flux adjacent to the rods exceed 205°C.  
Re-drying is carried out with the product removed from the original packaging and treated in an oven with an even temperature. It is recommended to have either an oven atmosphere circulation over a maximum flux height of 3 cm or to have the flux moving. The re-drying operation can be repeated to a maximum of 4 times. Re-dried flux and flux handled in the welding operation, shall be kept dry, preferably at a temperature of 50–120°C above ambient temperature, time unlimited.

### **4. Deteriorated product**

Welding fluxes that have suffered from serious water and moisture contamination, or have been exposed to the atmosphere over long periods of time cannot be restored in their original condition and should be discarded

### **5. Recycling**

Non consumed flux collected from the weld shall be cleaned from slag, metal and/or other contamination. Damage of the flux by heavy impingement in the transport system shall be prevented. Prevent separation of the different grain fraction in cyclones or in "dead" corners. Add new flux in the hopper in a circulation system before a level of 25% of the full hopper is reached.

## **SHELF LIFE FOR ALL CONSUMABLES**

Shelf life indicates how long our goods can be stocked at customer's premises and is not an integration to warranty.

Shelf life for all consumables is 3 years, with two exceptions described below, provided storage and handling conditions are met,

- for consumables with vacuum packing, shelf life can be extended to 5 years
- for Al (alloy) consumables, the shelf life is limited to 1 year.

Individual products might have a longer shelf life, but as standards or formulas might change, we do not extend shelf life.

# Lincoln® 6010

## TOP FEATURES

- Used for root and hot passes as well as filling and capping up to X52 Grades
- Also used for root passes on higher-strength pipe steels, up to X80
- When root pass welding, negative polarity is recommended
- Excellent weldability in all positions

## CLASSIFICATION

# Baso® G

## TOP FEATURES

- Designed for works highly strained at static and dynamic loadings and service temperature down to -50°C
- Excellent welding characteristics in all positions except vertical down position.
- Very low spatter in both DC and AC, with a high deposition rate
- Low moisture absorption properties ensure extra low diffusible hydrogen level in the weld metal (< 4ml/100g).
- Good slag release and flat bead appearance

## TOP FEATURES

- Excellent mechanical properties (impact down to -40 °C)
- Suitable for positional welding and welding with an inverter power source.
- Very low diffusible hydrogen content.
- The weld deposit has a very similar appearance to Cor-Ten A steel.

# LNM 12

## TOP FEATURES

- Used for welding low alloy creep resistant ferritic steels and fine grained steels
- Ideal for low temperature applications in the as welded condition with service temperatures in range -30°C to +500°C
- Recommended for welding 0.5% Mo low-alloy steels and for high strength steels.

## TYPICAL APPLICATIONS

- Oil & Gas
- Thermal Power
- Petrochemical
- Chemical

## TOP FEATURES

- The higher Si level results in a smooth weld bead shape and even appearance with excellent toe blending particularly in fillet welds.
- The weld metal has a high resistance to pitting and crevice corrosion by non-oxidising acids.
- Used for applications with service temperatures <400°C.

## TYPICAL APPLICATIONS

- Pipework
- Plates fabrication
- Shipbuilding
- Cladding

## TOP FEATURES

- The increased silicon content promotes weld pool fluidity resulting in a smoother weld deposit.
- Useful in case of difficult weldability.
- Often used as a buffer layer for hardfacing applications

## TYPICAL APPLICATIONS

- Hardfacing
- Exhaust Systems
- Dissimilar joints
- Quenched and tempered steels

## TOP FEATURES

- Used for welding galvanized steel sheets and components in the automobile industry.
- It is an iron-free aluminum bronze, which composition offers a very high resistance to sea water-corrosion and to the most commonly used acids in any concentrations and at a wide range of operating temperatures.
- High erosion resistance.

## TYPICAL APPLICATIONS

- Automotive components
- Galvanized Steels

# LNM CuSi3

## TOP FEATURES

- This wire is frequently used for joining in artistic foundries, for welding galvanized sheets and even as a steel cladding.
- It is also suitable for surfaces subject to corrosion.
- Used also for MIG brazing where a very small active component is suggested in the shielding gas.

## TYPICAL APPLICATIONS

- Cladding
- Brazing
- Automotive

# LNT 304L

## TOP FEATURES

- The low carbon content reduces the propensity to intergranular carbide precipitation, which increases the resistance to intergranular corrosion without the use of stabilizers.
- The weld metal provides good corrosion resistance properties to intergranular attack from a range of liquid media at service temperatures up to 300°C.
- Excellent mechanical strength and corrosion resistance.

## TYPICAL APPLICATIONS

- Pipework
- Petrochemical
- Nuclear Power generation

## APPROVALS

TIG

# SuperGlaze® TIG 4043

## TOP FEATURES

- Use on many weldable cast and wrought aluminium alloys
- Generally recommended for welding 5052, any 6XXX series alloys and castings
- Alloy embossed on each rod for easy identification

## TYPICAL APPLICATIONS

- Bicycle frames
- Pressure vessels

## APPROVALS

TÜV	DB	CE
+	+	+

# SuperGlaze® TIG 5183

## TOP FEATURES

- Designed for applications where higher strength is required
- For 5083 and 5654 base materials
- Excellent corrosion resistance ideal for Ship building and marine applications

## TYPICAL APPLICATIONS

- Marine
- Shipbuilding
- Cryogenic tanks
- Bicycle frames
- Railway Industry

## CLASSIFICATION

TIG

# SuperGlaze® TIG 5356

## TOP FEATURES

- Aluminium-magnesium alloy for use on many weldable cast and wrought aluminium alloys
- Excellent for color matching after anodizing
- Alloy embossed on each rod for easy identification
- General purpose filler alloy for 5XXX and 6XXX series alloys
- High strength filler metal

## TYPICAL APPLICATIONS

- Architectural structures
- Armored vehicles
- Gun mount bases

## APPROVALS

## TOP FEATURES

- Specially developed for welding with 100% CO<sub>2</sub> and optimised for Ar/CO<sub>2</sub> mix gas; smooth arc with low spatter
- Good mechanical properties (CVN > 47J) at -30°C for CO<sub>2</sub>)
- Perfect root pass welding on ceramic backing
- High current capacity, especially in positional welding
- Stable mechanical properties over the wider range of heat input

## TOP FEATURES

- The weld metal is resistant to intergranular corrosion up to 400°C, and non-scaling up to 800°C.
- Exhibits outstanding, almost spatter-free, welding properties with very easy slag removal from fillet welds, even in acute angles.
- The reduced welding fume (up to -40%) and the lower hexavalent Cr content (up to -60%) of the fume contribute to an improved working environment in the workshop, for all workers. Advantageous in confined spaces and with limited fume extraction systems.
- CLEARINOX F 316 L-PF is used for welding in the horizontal (PD), overhead (PE) and vertical-up (PF) positions.

## TOP FEATURES

- Advantageous in confined spaces and with limited fume extraction systems
- It exhibits outstanding, almost spatter-free, welding properties and produces finely rippled flat and smooth welds which are free of undercut
- Very easy slag removal
- Due to its fast-freezing slag, it can be used for welding in the horizontal (PD), overhead (PE) and vertical-up (PF) positions.

2.8	DRUM	56.0	ED022068

## ADDITIONAL INFORMATION

- All work-hardened base material and previously deposited material should be removed prior to applying a new deposit, since such areas are prone to embrittlement and possible cracking.
- No preheat is required on austenitic manganese steels although a preheat of between 150-200°C may be necessary on carbon and low steels to prevent heat affected zone cracking.
- Narrow stringer beads are preferred to avoid excessive heat build up in the base material. High heat input welds and interpass temperatures above 260°C causes manganese carbide precipitation resulting in embrittlement.
- There is no definite limitation to the number of passes that may be deposited, however, it is good practise to peen each pass immediately after welding to minimise internal stresses and possible distortion and cracking.
- Lincore 15CrMn deposits work harden rapidly making them difficult to machine. For best results carbide or ceramic cutting tools and rigid tooling should be used. Grinding can also be successfully employed.
- For applications involving severe impact and abrasion, a build-up of Lincore 15CrMn coupled with a single pass of Wearshield 60 or Lincore 60-O should be employed.
- The Lincore 15CrMn deposit can not be cut using the oxy-fuel process due to the high chromium content, however, plasma arc and air carbon arc processes are appropriate.

# Lincore® 33

2.0	SPOOL	11.3	ED031118
	COIL	22.7	ED011238
2.8	COIL	22.7	ED011240

## ADDITIONAL INFORMATION

- All work-hardened base material should be removed prior to applying Lincore 33 to prevent embrittlement and cracking.
- Preheat and postweld heat treatment is not generally necessary on C/Mn steels, however, preheat up to 260°C may be necessary on high carbon steels or large complex or restrained components.
- The deposited weld metal can be machined to exact dimensions using high speed or carbide cutting tools.
- There is no limit to the deposit build-up with this electrode.

# Lincore® 50

## TOP FEATURES

- Can be used on low carbon, medium carbon, low alloy, manganese and stainless steels
- Limited to 4 layers
- Delivers an abrasion resistant deposit, even under conditions of moderate impact
- Larger wire diameter sizes may be used for the submerged arc process

## TYPICAL APPLICATIONS

- Auger, Bar, Blade, Bucket, Bulldozer, Coal Mining
- Concrete, Crush, Cut/Teeth, Drag, Dredge, Hammer/Crush
- Hoist, Kiln, Mine Car/Wheel, Mix, Pipe Bend, Pipeline, Plate
- Power Generation, Pulverize, Pump, Roll/Hammer, Scrape/Cut, Screen
- Shovel, Shred/Hammer, Slag, Tamper, Teeth, Tractor

## CHEMICAL COMPOSITION (WEIGHT %), TYPICAL, ALL WELD METAL

2.8	COIL	22.7	ED011275
	DRUM	56.0	ED011274

## ADDITIONAL INFORMATION

- All work-hardened base material and previously deposited hardfacing material should be removed prior to applying a new deposit, since such areas are prone to embrittlement and possible cracking.
- Areas that contain irregularities such as cracks and deep gouges can be repaired locally using Wearshield BU30 or Wearshield 15CrMn prior to hardfacing with Lincore 50.
- Preheat is not necessary when surfacing austenitic substrates such as stainless steels and manganese steels, although the interpass temperature should be limited to about 260°C for manganese steels.
- For low alloy and carbon steels a preheat of 200°C is usually sufficient, but is dependent on material thickness and chemistry.

# Lincore® 55

## TOP FEATURES

- To be used on carbon steel, low alloy steel and manganese steel
- Unlimited layers with proper preheat and interpass temperatures and procedures
- Delivers a deposit which resists metal-to-metal rolling or sliding wear as well as mild abrasion

## TYPICAL APPLICATIONS

- Bark removing, Blade, Blower, Brake, Crane, Crush
- Drag, Drive, Drum, Excavate, Extrusion, Hammer
- Ingot, Kiln, Loader, Logging, Mill, Mine Car
- Mix, Open Hearth, Plate, Power Generation, Rail, Roll
- Shovel, Sinter, Teeth, Tractor, Wheel

## CHEMICAL COMPOSITION (WEIGHT %), TYPICAL, ALL WELD METAL

	COIL	22.7	ED011278
2.8	COIL	22.7	ED011280
	DRUM	227.0	ED037695

## ADDITIONAL INFORMATION

- All work-hardened base material and previously deposited material should be removed prior to applying a new deposit, since such areas are prone to embrittlement and possible cracking.
- A preheat of up to 250°C is necessary to prevent cracking in situations of high restraint and/or heavy thicknesses. Interpass temperatures between 150 - 300°C do not adversely effect deposit hardness.
- The deposit thickness is usually limited to 2 layers on high carbon or alloy steels and/or situations of high restraint and heavy sections due to the risk of cracking. Higher preheat and interpass temperatures coupled with slow cooling will minimise the risk of cracking.
- The deposited weld metal is not machinable by conventional methods although the deposit can be shaped by grinding.
- The deposit can be softened by annealing at 875°C for one hour and slow cooling (air cool 22- 43HRc, furnace cool 15-17HRc). The hardness can be restored by heating at 875°C followed by water quenching (50-59HRc).
- The component should then be tempered at 150-200°C for one hour (54-59HRc) to retain some toughness.

FCAW

# Lincore® 60-0

## TOP FEATURES

- To be used on carbon, low alloy, manganese and stainless steels and cast iron
- Deposit is limited to two layers
- Deposits feature higher alloy levels than to resist both abrasion and moderate impact

## CURRENT TYPE

DC+

## WELDING POSITIONS

Flat/Horizontal

## TYPICAL APPLICATIONS

- Bucket lips
- Crusher hammers
- Ore chutes
- Dozer blades
- Ripper Teeth

## CHEMICAL COMPOSITION (WEIGHT %), TYPICAL, ALL WELD METAL

4.2	1.6	1.3	25.4	0.6

## MECHANICAL PROPERTIES, TYPICAL, ALL WELD METAL

Layer	Typical hardness values
1	55 - 60 HRc
2	58 - 60 HRc

Welded on Mild Steel Plate (12mm)

## PACKAGING AND AVAILABLE SIZES

Wire diameter (mm)	Packaging	Weight (kg)	Item number
1.1	SPOOL	4.5	ED037262
	SPOOL	11.3	ED031131
1.6	SPOOL	4.5	ED037263
	SPOOL	11.3	ED031132
2.0	SPOOL	11.3	ED031133
	COIL	22.7	ED019887
	DRUM	227.0	ED037493
2.8	COIL	22.7	ED019888

## ADDITIONAL INFORMATION

- When welding with Lincore 60-0 stringer beads should be employed. Weaving is not advised since wide weaves generally increase the check crack spacing which can result in deposit spalling.
- Preheat is not necessary when surfacing austenitic substrates such as stainless steels and manganese steels, although the interpass temperature should be limited to about 260°C for manganese steels. For low alloy and high carbon steels a preheat of 200°C is necessary to prevent heat affected zone cracking.
- The weld metal is not machinable or forgeable and it readily check cracks. The deposit thickness is usually limited to 2 layers, as excessive build-up will result in chipping and fragmentation.
- For applications requiring build-ups in excess of 2 layers, buttering layers of Lincore 33, Wearshield BU30 or RepTec 126.
- Alternatively, a preheat of 650°C can be used to eliminate the formation of check cracks.

# Lincore® M

## TOP FEATURES

- Recommended for build-up and repair of Hadfield-type austenitic manganese materials as well as carbon and low alloy steels
- Unlimited layers with proper preheat and interpass temperatures and procedures
- Deposit resists severe impact as well as moderate abrasion

## TYPICAL APPLICATIONS

- Bar, Bucket, Crush, Cut, Drag, Dredge
- Hammer, Mill, Mix, Open Hearth, Plate
- Power Generation, Pump, Rail, Roll
- Screen, Shovel, Teeth, Wheel

## CHEMICAL COMPOSITION (WEIGHT %), TYPICAL, ALL WELD METAL

C	Mn	Si	Cr	Ni
0.6	13.0	0.4	4.9	0.5

## MECHANICAL PROPERTIES, TYPICAL, ALL WELD METAL

Condition	Typical hardness values
As deposited	18-28 HRC
Work hardened	30-48 HRC

## PACKAGING AND AVAILABLE SIZES

Wire diameter (mm)	Packaging	Weight (kg)	Item number
1.1	SPOOL	11.3	ED031128
1.6	SPOOL	11.3	ED031129
2.0	SPOOL	11.3	ED031130
	COIL	22.7	ED011160
2.8	COIL	22.7	ED011164
	DRUM	56.0	ED011163
	DRUM	272.0	ED011162

## ADDITIONAL INFORMATION

- All work-hardened base material and previously deposited material should be removed prior to applying a new deposit, since such areas are prone to embrittlement and possible cracking.
- No preheat is required on austenitic manganese steels although a preheat of between 150-200°C may be necessary on carbon and low steels to prevent heat affected zone cracking.
- Narrow stringer beads are preferred to avoid excessive heat build up in the base material. High heat input welds and interpass temperatures above 260°C causes manganese carbide precipitation resulting in embrittlement.
- There is no definite limitation to the number of passes that may be deposited, however, it is good practise to peen each pass immediately after welding to minimise internal stresses and possible distortion and cracking.
- Lincore M deposits work harden rapidly making them difficult to machine. For best results carbide or ceramic cutting tools and rigid tooling should be used. Grinding can also be successfully employed.

# Lincore® T&D

## TOP FEATURES

- Delivers a deposit similar to H12 tool steel
- For build-up of tool steel dies and edges, or applying wear resistance surface on carbon or low alloy steels
- To be used on carbon steel, low alloy steel or tool steel

## CURRENT TYPE

DC+

## WELDING POSITIONS

Flat/Horizontal

## TYPICAL APPLICATIONS

0.65	1.5	0.8	7.0	1.8	1.4	1.6

## MECHANICAL PROPERTIES, TYPICAL, ALL WELD METAL

Layer	Typical hardness values
1	48 - 55 HRc
2	55 - 65 HRc

Welded on Mild Steel Plate (12mm)

## PACKAGING AND AVAILABLE SIZES

Wire diameter (mm)	Packaging	Weight (kg)	Item number
1.6	SPOOL	11.3	ED031134

## ADDITIONAL INFORMATION

- A preheat and interpass temperature of 325°C, or higher (up to 540°C), are necessary to avoid cracking. It is important to ensure that an adequate "soak" is achieved prior to the welding operation.
- After welding, the component should be covered and slow cooled down to room temperature. Once cooled, the weldment should be post weld heat treated to temper the martensite and toughen the deposit.
- Tempering at 540°C normally produces the optimum combination of hardness and toughness.
- The deposited weld metal is not machinable by conventional methods although the deposit can be shaped by grinding.
- Annealing at 850°C for several hours and slow cooling will reduce the hardness to approximately 30HRc. This deposit can be readily machined. Rehardening is achieved by heating to about 1200°C for several hours to dissolve all carbides and homogenise the steel, followed by air cooling and tempering.
- Lincore T&D cannot be cut by the oxy-fuel processes. Plasma arc and air-carbon arc processes can be used to both cut and gouge the weld deposit. Preheat temperatures similar to those for welding may be necessary to prevent cracking along the cut edge.

LNS 140TB (LA-81)	TR	600	720	25	100	65		45	220-235
Procedure 3									
LNS 133TB	TR	600	700	27	120			90	

Remark: the mechanical properties from butt welds in pipe depends on the chemical composition of base material.  
Procedure 1: tandem in 12.5mm X65; Procedure 2: multiwire weld (4/5 wires) in 19-25mm X65; Procedure 3: AWS test plate

\* TR = Two-Run

## FLUX CHARACTERISTICS

Current type	DC/AC
Basicity (Boniszewski)	1.3
Solidification speed	Medium
Density (kg/dm <sup>3</sup> )	1.0
Grain size (ISO 14174)	2 - 20

## PACKAGING AND AVAILABLE SIZES

Packaging	Weight (kg)	Item number
PE BAG	25.0	111218
SRB BAG	25.0	111220
SRB BIG BAG	1000.0	FX995N-1TSRB
BIG BAG	1200.0	111712

# 998N

## TOP FEATURES

- Suitable for both seam and spiral pipe welds
- Recommended for automatic single pass/2-run welding with up to five arcs
- Very high current capacity

## CLASSIFICATION

Packaging	Weight (kg)	Item number
SRB BAG	25.0	FXP2007-25SRB

**BENEFITS****For a well-made welding bead:**

- Without copper contamination
- Without risk of burn through in the first pass position (used as a support)
- Without re-welding
- Without risk of lack of fusion
- No turning of the work piece
- Bigger root thickness permits higher welding current for the hot pass
- An increase in first pass deposit rate
- Wide root gap
- Total penetration without turning the parts to be welded
- Total penetration of joints difficult to access in reverse position
- Smooth profile of the root pass

**For a well-made weld preparation before welding:**

- Ideal to compensate for variations in preparation of sheet edge backlashes
- Easy to use (adhesive/metallic support)
- Simplify chamfering preparations

**For higher productivity:**

- Without gouging operation
- Without grinding operation
- Provides time saving and high quality
- Easy-to-use slats technique

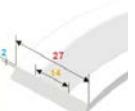

KERALINE has a very low moisture absorption rate and a high melting point, allowing use at high welding intensity, up to 600A.

**The selection of KERALINE slat types for different welding processes**
